TripNest AI: User Guide

Version 2.0 · 2 November 2026. No account is needed.

What TripNest AI tells you

How crowded places near you are **predicted** to be on the date you choose, the calmest time of day to visit, and lesser-known places worth visiting instead. The numbers are an ML prediction trained on demonstration data, not live counts.

Start

1. Open the home page. Nothing asks for your location yet.
2. **Location.** Press **Use my current location** (your browser asks permission first) or type a city and pick it from the list. If you refuse permission, simply type a city.
3. **Date** (default: the next Saturday) and an optional **interest**, such as Beaches or Heritage.
4. Press **Explore Destinations**. The heading says, for example, "Discover amazing places around Coimbatore."

The results page

- **Popular places near you.** Photo, state, distance, a crowd chip (green quiet, yellow moderate, red high), best time, short description, **View Details**.
- **Best time to visit.** Pick a place to see four parts of the day (early morning, morning, afternoon, evening), the calmest one highlighted, and a line such as "Best time to visit: 8:00 AM – 9:00 AM". If the data cannot support a recommendation, none is given.
- **Escape the Crowds.** Lesser-known places that are predicted to be calm on your date, each with the reason it was chosen.
- **Crowd map.** Your position, popular places and hidden gems with different markers. Filters: All, Popular, Hidden gems, Low, Moderate, High. Tap a marker for a photo, level, best time and **View Details**. "View on map" on a card jumps here.
- The bar at the top changes the location, date, interest or time of day and refreshes everything.

Crowd levels are shares of an *assumed* capacity. Distance is a straight line, not a road distance.

The destination page

Choose a date and time range for the predicted level, the number of people with a likely range, the four-part timeline, the best time, an hourly chart, seven day tiles, the places inside, a map, and **About this prediction** (when it was made, what it is built from, limitations). "Why we showed you this" appears only when you arrived from a search.

If something goes wrong

You see	What to do
Location field asks for a city	Type a city, or allow location
"We couldn't find …"	Choose a suggestion or a nearby larger city
Date message	Pick a date within the next 18 months
"No best time recommended"	The place is busy all day or open too briefly; try another date
A neutral box instead of a photo	The photo host is unreachable; everything else works
Map missing	The map service needs internet access

Privacy

No sign-in. Nothing about you is stored. A shared location is rounded to about 1 km, used only to find places near you, and not kept.
